## Introduction

Although our software satisfy the requirements but it also contains some issues and problems, in this document we will discuss honestly the known issues in the systems .

### ISSUE1 : weak error handling

The TMU couldn't handle the request if the last request execution time exceeds 1 ms, in this case the TMU ignores the request.

### ISSUE2 : fixed buffer size

Although the buffer size is a pre configuration parameter but it is a fixed number during the run time, if the buffer is full then any additional requests will be automatically ignored (no dynamic allocation used).
